

Section 12.3

Odds

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 1

Odds Against

- Odds against event = $\frac{P(\text{event fails to occur})}{P(\text{event occurs})}$
 $= \frac{P(\text{failure})}{P(\text{success})}$

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 2

Example: Odds Against

- Example: Find the odds against rolling a 5 on one roll of a die.

- $P(5) = \frac{1}{6}$ $P(\text{fails to roll a 5}) = \frac{5}{6}$

$$\begin{array}{l} \text{odds against} \\ \text{rolling a 5} \end{array} = \frac{\frac{5}{6}}{\frac{1}{6}} = \frac{5}{6} \cdot \frac{6}{1} = \frac{5}{1}$$

The odds against rolling a 5 are 5:1.

Chapter 12 Section 3 - Slide 3

Odds in Favor

- Odds in favor of event = $\frac{P(\text{event occurs})}{P(\text{event fails to occur})}$
 $= \frac{P(\text{success})}{P(\text{failure})}$

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 4

Example

- Find the odds in favor of landing on blue in one spin of the spinner.

$$P(\text{blue}) = \frac{3}{8} \quad P(\text{not blue}) = \frac{5}{8}$$

$$\text{odds in favor} = \frac{\frac{3}{8}}{\frac{5}{8}} = \frac{3}{8} \cdot \frac{8}{5} = \frac{3}{5}$$

The odds in favor of spinning blue are 3:5.

Chapter 12 Section 3 - Slide 5

Probability from Odds

- Example: The odds against spinning a blue on a certain spinner are 4:3. Find the probability that
 - a) a blue is spun.
 - b) a blue is not spun.

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 6

Solution

- Since the odds are 4:3 the denominators must be $4 + 3 = 7$.
- The probabilities ratios are:

$$P(\text{blue}) = \frac{3}{7}$$

$$P(\text{not blue}) = \frac{4}{7}$$

Chapter 12 Section 3 - Slide 7

Section 12.4

Expected Value (Expectation)

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 8

Expected Value

- $$E = P_1 \cdot A_1 + P_2 \cdot A_2 + P_3 \cdot A_3 + \dots + P_n \cdot A_n$$
- The symbol P_1 represents the probability that the first event will occur, and A_1 represents the net amount won or lost if the first event occurs.
- P_2 is the probability of the second event, and A_2 is the net amount won or lost if the second event occurs.
- And so on...

Chapter 12 Section 3 - Slide 9

Example

- Teresa is taking a multiple-choice test in which there are four possible answers for each question. The instructor indicated that she will be awarded 3 points for each correct answer and she will lose 1 point for each incorrect answer and no points will be awarded or subtracted for answers left blank.
 - If Teresa does not know the correct answer to a question, is it to her advantage or disadvantage to guess?
 - If she can eliminate one of the possible choices, is it to her advantage or disadvantage to guess at the answer?

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 10

Solution

- Expected value if Teresa guesses.

$$P(\text{guesses correctly}) = \frac{1}{4}$$

$$P(\text{guesses incorrectly}) = \frac{3}{4}$$

$$\begin{aligned} E &= \frac{1}{4}(3) + \frac{3}{4}(-1) \\ &= \frac{3}{4} - \frac{3}{4} = 0 \end{aligned}$$

- Therefore, over the long run, Theresa will neither gain nor lose points by guessing.

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 11

Solution (continued) —eliminate a choice

- $P(\text{guesses correctly}) = \frac{1}{3}$

$$P(\text{guesses incorrectly}) = \frac{2}{3}$$

$$\begin{aligned} E &= \frac{1}{3}(3) + \frac{2}{3}(-1) \\ &= 1 - \frac{2}{3} = \frac{1}{3} \end{aligned}$$

- Therefore, over the long run, Theresa will, on average, gain $\frac{1}{3}$ point each time she guesses when she can eliminate one choice.

Chapter 12 Section 3 - Slide 12

Example: Winning a Prize

- When Calvin Winters attends a tree farm event, he is given a free ticket for the \$75 door prize. A total of 150 tickets will be given out. Determine his expectation of winning the door prize.

$$E = \frac{1}{150}(75) + \frac{149}{150}(0) \\ = \frac{1}{2}$$

- Therefore, Calvin's expectation is \$0.50, or 50 cents.

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 13

Example

- When Calvin Winters attends a tree farm event, he is given the opportunity to purchase a ticket for the \$75 door prize. The cost of the ticket is \$3, and 150 tickets will be sold. Determine Calvin's expectation if he purchases one ticket.

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 14

Solution

$$\begin{aligned} E &= \frac{1}{150}(72) + \frac{149}{150}(-3) \\ &= \frac{72}{150} - \frac{447}{150} \\ &= -\frac{375}{150} \\ &= -2.50 \end{aligned}$$

- Calvin's expectation is $-\$2.50$ when he purchases one ticket.

Chapter 12 Section 3 - Slide 15

Fair Price

Fair price = expected value + cost to play

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 16

Example

- Suppose you are playing a game in which you spin the pointer shown in the figure, and you are awarded the amount shown under the pointer. If it costs \$10 to play the game, determine:
 - the expectation of the person who plays the game.
 - the fair price to play the game.

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 17

Solution

Amt. Shown on Wheel	\$2	\$10	\$15	\$20
Probability	3/8	3/8	1/8	1/8
Amount Won/Lost	-\$8	\$0	\$5	\$10

$$\begin{aligned}
 E &= \frac{3}{8}(-\$8) + \frac{3}{8}(\$0) + \frac{1}{8}(\$5) + \frac{1}{8}(\$10) \\
 &= \frac{-24}{8} + 0 + \frac{5}{8} + \frac{10}{8} \\
 &= \frac{-9}{8} = -1.125 \approx -\$1.13
 \end{aligned}$$

Copyright © 2009 Pearson Education, Inc.

Chapter 12 Section 3 - Slide 18

Solution

- Fair price = expectation + cost to play
= $-\$1.13 + \10
= $\$8.87$

Thus, the fair price is about $\$8.87$.
